## TONOPAH 76

On the estate of the Tonopah "76" Consolidated, No. 1 shaft, on the "76" claim, and No. 2 shaft, on the eastern section of the ground, each gained an additional 10 feet during the week, giving the former a total depth of 165 feet and the latter 100 feet. No. 1 shaft recently passed through 30 feet of mixed up rhyolite and quartz and is now exposing rhyolite in solid formation. No. 2 shaft is still in the overflow capping.

## UMATILLA TONOPAH

Excellent headway was made during the week in sinking the shaft on the Umatilla Tonopah property, it having been sunk 30 feet, giving it a total depth of 600 feet. The bottom is still revealing the cap rock but indications are favorable for a change in the near future.

## GREAT WESTERN

Sinking in the shaft on the Great Western Consolidated property continues to make good headway. The 570-foot point has been reached. When the lode porphyry, which in adjoining properties has been exposed at a depth of about 700 feet, is reached, an extensive campaign of crosscutting will be inaugurated.

For quick results try the want ad columns of the Bonanza.

TONOPAH - NEVADA

## BELMONT

(Continued from page 1)

an increase.

1190-foot level—On the Desert Queen side, crosscut No. 1 made the usual progress without any change in conditions. The west drift on the Middle vein made the usual progress without any material change. Raise No. 12 in the east drift on the Shaft vein, made good headway, exposing a full face of good ore. Raise No. 11 on the Shaft vein, work in which was recently resumed to connect with the intermediate level run from raise No. 8, advanced the usual distance in ore of a good grade.

1166-foot level—There was a slight improvement in the value of ore extracted from the face of the east drift from crosscut "H", the rock being better than a fair grade.

12th level—Raise No. 6, sent up to prospect the Shaft vein between this and the level above, made good headway in trachyte without any change in conditions. North crosscut No. 4 made the usual progress and cut a streak of very good ore, the extent of which has not yet been determined. The northwest crosscut, in which a 3-foot streak of ore was cut last week, continues to intersect other seams of quartz of fair value but thus far no drifting has been done on the new finds.

13th level—The work of cutting out for a pump sump is still in progress, a preliminary to the resumption of sinking in the shaft. The east drift made good headway in an excellent grade of ore.

## NORTH STAR

(Continued from page 1)

Brady is absent from camp at present and in consequence no information of an official nature is obtained. It is understood that he plans to resume sinking operations in the shaft at an early date, sending it down to an additional lift of 190 feet to the 1350-foot point, from which depth a crosscut to the ledge, which dips to the northwest, will be run to intercept the downward extension of the new rich shoot on the 1250-foot level.

Drifting east and raising on the 850-foot level made excellent progress during the week on 2 to 3 feet of good ore on the 850-foot level. To search for a probable upward extension of the new rich shoot a crosscut to the south has been started on the 850-foot level. A carload of 40 tons of average grade ore was shipped Thursday to the old Belmont mill.

## MONTANA-TONOPAH

(Continued from page 1)

in the southeast end of the stope. 565-foot level—Stoping continues on the Shaft vein, producing some fair mill ore. The ore has been considerably broken up the last few days. The crosscut south from the eastern portion of the Triangle vein advanced 37 feet, cutting a stringer of about a foot of low grade ore supposed to be the continuation of the north branch of the Triangle vein to the west. A drift was started east on the stringer. The crosscut south from the MacDonald vein advanced 10 feet in trachyte. The west drift on the vein cut in that crosscut advanced 13 feet on about a foot of low grade quartz and was discontinued for the present. The crosscut is being sent ahead to connect with the west drift on the Martha vein.

615-foot level—Stoping on the Triangle, the north branch of the Triangle, the Martha, a branch of the South, and the Shaft veins continue to produce a moderate tonnage of good mill ore. A raise was started from an old north crosscut about 300 feet west of the main north crosscut on a small streak of quartz which appears to be the continuation of the A. B. K. vein. The stringer has widened out from 2 to 10 inches in width in the last few days.

665-foot level—The west drift on the north branch of the Triangle vein was advanced 3 feet and discontinued for the present. The face still shows low grade quartz. The crosscut south from the east drift on the South vein advanced 4 feet and was discontinued for the present. Drifting was started the early part of the week on a vein of low grade quartz intersected in the crosscut about 40 feet from the drift. The drift work on the new vein to the east advanced 5 feet and to the west 12 feet, and was discontinued for the present. The northeast crosscut from the South vein, being driven to prospect for an eastern

extension of the MacDonald vein, advanced 13 feet and cut low grade quartz, measuring about 1½ feet in width, on which a drift to the west was advanced 13 feet. Stoping on the downward extension of the north branch of the Triangle vein made good progress on about 4 feet of good ore. The stope on the eastern portion of the Martha vein is doing nicely, producing a grade of ore that closely approaches high grade. 700-foot level—Stoping was started on the downward extension of the north branch of the Triangle vein and the work is yielding a good grade of ore. The crosscut north-west through the faulted western section of the vein advanced 11 feet and cut some low grade quartz. A drift was started east from the crosscut on good mill ore, with spots of good quartz that shows ruby silver. This drift is apparently on the hanging wall of what is thought to be the MacDonald vein. Stoping on the C. E. K. vein continues to produce its average yield of good ore.

765-foot level—The north crosscut from the main east crosscut advanced 8 feet.

## TONOPAH MERGER

(Continued from page 1)

pose streaks of high grade freely impregnated with hornsilver and ruby silver. As the ore is being extracted and piles on the dump, it is of an exceedingly good grade of commercial ore. While the drift is exposing only about four feet of ore, the ledge has a total width of about 22 feet, all of which, it is believed, will prove of a milling grade when stoping operations on an extensive scale get under way. The raise on the footwall of the vein about 50 feet from the present drift face has attained a height of about 20 feet. It is exposing ore of a grade similar to that on the drift face. A drift to the east along the footwall of the vein has been started and is now about 25 feet long, with a full face of fair ore. A north crosscut has also been started to prospect the country in the vicinity of the contact of the rhyolite with the breccia.

1070-foot level—The work of cutting out the station has been completed and crosscutting is now in progress toward the northwest to intercept the downward extension of the new big vein and also pick up the extension of a vein from the Tonopah Extension ground.

## TONOPAH MINING

(Continued from page 1)

shaft, the face being in rhyolite, and a stope was started on the South vein on 4 to 5 feet of average grade ore. Operations were likewise resumed in the west drift on the South vein on the 800-foot level, the face showing no values at present.

A total of 209 feet of development work was performed in the various mines of the company, being distributed as follows: Mizpah, 11; Red Plume, 52; Silver Top, 137 and the Desert Queen 9.

A detailed account of the work in the various mines during the week follows:

## Mizpah Shaft

290-foot level—The west drift on the Burro vein, west of the Silver Top fault, made the usual progress with no change in conditions. Stoping continues on the Mizpah footwall vein on 2 feet of average grade ore.

300-foot level—The usual tonnage was yielded by stoping operations on the Mizpah foot wall vein.

400-foot level—Stoping on the Mizpah footwall vein continued to make good headway and yield its full quota of ore.

500-foot level—Operations continue to be confined to stoping on the Valley View vein, west of the shaft, on 5 feet of average grade ore. Red Plume Shaft.

600-foot level—The west drift toward the Sand Grass shaft made the usual progress with no change in conditions. The raises in the footwall of the South vein were connected with the stope above. Good headway was made in stoping on the South vein on 6 to 8 feet of mill ore.

700-foot level—The east intermediate drift on the North vein was extended the usual distance on about 2 feet of low-grade ore. No stoping was done on this level.

## Desert Queen Shaft

600-foot level—The west drift toward the Sand Grass shaft made the usual progress with no change in conditions. The raises in the foot wall of the South vein were connected with the stope above. Good headway was made in stoping on the South vein on 6 to 8 feet of

mill ore.

700-foot level—The east intermediate drift on the North vein was extended the usual distance on 2 feet of low grade ore. No stoping was done on this level.

## Desert Queen Shaft

700-foot level—Work was resumed in the north crosscut, west of the shaft, the face being in rhyolite. A stope was started on the South vein on 4 to 5 feet of average grade ore.

800-foot level—Work was resumed in the west drift on the South vein. The face shows no values at present.

## Silver Top Shaft

240-foot level—The raise on the Valley View vein made the usual progress on 2 feet of mill ore. The stope on the Valley View vein, west of the shaft, made the usual headway on 2 feet of average grade ore. 340-foot level—Stoping operations on the Valley View footwall vein went ahead the usual distance on 3 to 4 feet of mill rock, as did work in the raise on the Valley View vein west of the shaft on 3 feet of like grade of ore.

440-foot level—Work was resumed in an old raise west of the shaft and it was connected with the stope above. Stoping was continued on the Valley View and the Valley View footwall veins on 3 to 4 feet of milling ore.

540-foot level—The west drift from the south crosscut west of the shaft, made the usual headway on 2 to 3 feet of mill ore. The raise on the west end of the Valley View vein made the customary progress, showing up a few stringers of quartz. The raise from the top of the stope on the Silver Top vein, east of the shaft, connected with the level above. The west drift on the South vein made the usual headway on 2 feet of mill ore. Stopes on the Valley View footwall vein yielded their usual quota of ore, going ahead on 4 to 5 feet of mill ore.

640-foot level—The main east drift, work in which was resumed recently to pick up the downward extensions of the veins above, made good progress with no change in conditions. The usual good results were obtained in stoping on the Valley View vein. 740-foot level—The west drift from the north crosscut, recently started, made good headway on a stringer of average grade ore.

## WEST END

(Continued from page 1)

600-foot level—The work of cutting a station at the shaft was completed and the crosscut toward the vein was extended 15 feet, giving it a total length at present of about 90 feet.

## GYPSY QUEEN

As previously announced in the Tuesday issue of the Bonanza, the crosscut to the north on the 600-foot level of the Gypsy Queen mine, at a point about 125 feet from the shaft, intersected the downward extension of the ledge opened up some time ago on the 400-foot level, a winze sunk to a depth of 40 feet revealing 4 feet of ore that assays from \$3 to \$14 a ton. On the deeper level where cut, the vein disclosed about 3 feet of black sulphide quartz, ranging in value between \$2 and \$4 a ton. The crosscut then exposed a "horse" or waste about a foot in width, which for a time appeared to be the hanging wall.

Convinced that further work in the crosscut would prove the vein of greater proportion, Superintendent George Murphy decided to continue it, and was rewarded by an additional discovery, after penetrating the foot of waste, in the shape of a second section of the vein, which is yielding quartz of a character that leaves no doubt as to its value-bearing qualities. Assays are today being made upon the rock. The additional find has been explored a distance of about 5 feet and conditions are present to indicate that the hanging wall proper will soon be revealed. The entire vein, exclusive of the "horse" referred to, now has a total width of about 8 feet.

Superintendent Murphy is continuing the crosscut for the purpose of cutting the downward extension of a parallel ledge, which was opened up some years ago on the 300-foot level about 160 feet north of the shaft and showed a width of from 5 to 7 feet, dipping to the north on an angle of about 35 degrees and striking east and west. On the 300 level, this vein was explored with drifts for about 200 feet, in which distance it averaged 6 feet in width and returned low-grade values. It is calculated that this ledge will be picked up on the 600-foot level about 200 feet from the face of the present north crosscut, which has a total length at present of about 135 feet.

## TONOPAH MIDWAY

Considering that hand steel is being used, good headway is being made in the sinking of the new main working shaft on the Midway mine, it having been sunk 15 feet during the week, giving it a total depth at present of more than 30 feet. The galloways frame is in position and the drum and motor for the new shaft arrived several days ago. The work of assembling the hoist equipment is at present being held back by the delay in the arrival of a much-needed gear wheel. It is expected that it will arrive in the next day or two. Work in the winzes on the 535-foot level made good headway during the week, yielding 50 tons of ore of good value, some of it running very high—that was shipped to the old Belmont mill at Millers.

## MIZPAH EX

Good headway is being made in the operations on the 1160-foot level of the Mizpah Extension. During the week the north crosscut was advanced 11 feet and the east crosscut from the south crosscut 47 feet. In the latter a stringer of quartz was cut a few days ago.

## MONARCH PITTS EX.

The sinking of the main shaft on the ground of the Monarch Pittsburg Extension Mining company made excellent progress during the week, 18 feet being gained, which gives the bore a total depth of 915 feet.

## NEW GOLDEN CROWN

All work and preparations necessary to the resumption of sinking operations in the shaft of the New Golden Crown have practically been completed. The cleaning out of the sump below the 600-foot level is in progress and sinking should again be underway in the near future.

George Conlett, one of the pioneers of this district, arrived from the north this morning and will spend a day or two here looking after business interests.

## FOR SALE!

BURROUGHS ADDING  
MACHINE  
Complete with stand and  
dust cover

9-column machine with column  
release keys, also total, repeat  
and release keys.

Is in perfect working order
